

Executive Summary – Complete Business Analysis Project

Business Problem

Businesses often struggle to make data-driven decisions due to fragmented insights across different domains. This project addresses three real-world business challenges: understanding factors affecting house prices, identifying reasons behind customer churn, and analyzing sales performance across regions and time.

Objective

The primary objective of this project is to perform an end-to-end business analysis using real datasets, apply statistical and exploratory techniques, and deliver actionable insights that support strategic decision-making.

Key Findings

- House prices show strong correlation with numeric factors such as area and property features.
- Customers on short-term or high-cost plans exhibit higher churn rates.
- Sales performance varies significantly by region, with certain regions consistently generating higher revenue.

Business Impact

The insights derived from this analysis enable organizations to optimize pricing strategies, improve customer retention programs, and enhance regional sales planning. Implementing the recommendations can lead to improved revenue stability, reduced churn, and better allocation of resources.

High-Level Recommendations

- Focus real estate marketing efforts on high-impact pricing factors.
- Introduce targeted retention strategies for high-risk churn customers.
- Replicate best-performing regional sales strategies across underperforming regions.
